

Regular Workshop – October 17, 2016  
Agenda Item 8

Agenda Item: Canal Dredging Feasibility Study Update

Presenter: Town Manager and staff

Summary: The Town performed its first ever canal dredging project in 2003. In 2013, the Public Works Department performed manual soundings of approximately 40 canals throughout the Town. The results of that survey were presented to the Town Commission at the December 11, 2013 Workshop. The Town Commission then directed staff to initiate a more detailed survey and perform a full canal feasibility study of all Town canals.

Taylor Engineering (Jacksonville and Sarasota, FL) was engaged to perform the feasibility study that, among other things, included additional reconnaissance surveys, planning level dredging volumes and associated preliminary opinions of probable costs and potential funding options. Taylor Engineering will present interim findings at the October 17, 2016 Regular Workshop Meeting.

Attachments: 10-07-16 Memo, Public Works Director to Manager;  
Taylor Engineering, Inc. Canal Feasibility Study.

Recommended

Action: Pending discussion, provide direction to Manager.

# MEMORANDUM

Date: October 10, 2016

**TO:** Dave Bullock, Town Manager  
**FROM:** Juan Florensa, Public Works Director  
**SUBJECT:** Canal Feasibility Study Update

---

The Town of Longboat Key is defined by its coastline. While the Gulf of Mexico waters that lap Town's shoreline are enjoyed by many visitors and residents, the Town's saltwater canal area is also an important component of the Town's coastal system. All of these canals are located along the eastern side of the Key and can be accessed from Sarasota Bay.

Some of the canals were excavated (dredged) by developers as the Town was built. The canals provided an attractive selling/marketing feature for new homes and condominiums. Over the last four decades the canals slowly silted in shoaling to the point of becoming difficult to navigate especially at low tide. In 2003, the Town performed its first ever canal dredging project. Thirty canals were dredged. Approximately 23,000 cubic yards of material was excavated and disposed of. The construction cost was \$1.5 million. Dredging began in March 2003 and was completed in December 2003. The project was funded from the Town's General Fund (Ad Valorem), Infrastructure Surtax, and West Coast Inland Navigation District (WCIND) grants.

In 2013, the Public Works Department performed manual depth soundings of approximately 40 canals throughout the Town. The recorded depths were corrected to daily tide elevation. The results of that survey were presented to the Town Commission at the December 11, 2013 Regular Workshop Meeting. The survey confirmed there was generally good depth for navigation but certain areas had increased rates of shoaling. These specific areas were concentrated at the mouth of the canals or near stormwater drainage pipe outfalls.

The Town Commission directed staff to initiate a more detailed survey and perform a full feasibility study of all Town canals. In 2013, Taylor Engineering (Jacksonville and Sarasota, FL) was engaged to perform the feasibility study. Among the tasks Taylor was requested to perform were more detailed surveys, provide planning level dredging volumes and associated preliminary opinions of probable costs. Taylor was also asked to investigate funding options for canal dredging.

Taylor estimates that as much as 95,000 cubic yards of material will eventually need to be excavated at the current rate of shoaling to restore all canals to the State-permitted depths. Planning level construction cost estimate range is about \$2.5 million to \$6 million depending on the extent and timing of the work.

We currently have a fund balance of \$517,399 in the canal dredging fund and another \$700,000 available in the Infrastructure Surtax which competes with the cash balance available in the IST Fund for a total of \$1,217,399.

If the Commission desires to move forward, staff has identified the following next steps and proposed timeline:

- FY 2016-2017 – Complete formal Bathymetric Survey of canals, prepare design and permitting documents; submit to Florida Department of Environmental Protection (FDEP) and US Army Corps of Engineers (USACE) for review and approval.
- FY 2017-2018 – Obtain permits from regulatory agencies. Formalize and enact the required legislation if all or part of the funding will be through special taxing district or other forms other than ad-valorem.
- FY 2018-2019 – Begin construction.

Taylor Engineering staff will be present at the October 17, 2016 Regular Workshop Meeting to review in detail the work performed to date. The attached PowerPoint presentation will be discussed as well.

Please contact me if you have any questions or require additional information.

# Town of Longboat Key Project Update

## Canal Dredging Feasibility Study

October 17, 2016

# Project Approach – Technical Elements

---

- Ø Tasks 1 and 2: Start with common database for long-term consistency
  - Acquire/update Town's GIS
  - Integrate property appraiser's data
  - Framework for adding field data
- Ø Task 3: Field Data Collection
  - Question of balancing cost vs. need
    - Bathymetry
    - Sediment
    - Resources
  - On-going monitoring program

# Task 1: Data Collection and Review

## 2013 Soundings

# Task 1: Data Collection and Review

53 navigable canals have been inventoried by the Town.

Longboat Key Canal Dredging Report

## Regulatory Exemptions, Permits....

### **40D-4.051 Exemptions from Permitting.**

The performance of maintenance dredging of existing manmade canals, channels, basins, berths [...] to a depth of no more than 5 feet *below mean low water*.

# Navigable Depth of Trafficsheds

Resources including:

- Regional Waterway Management System Reports, Robert Swett and Gustavo Antonini for Manatee County (2002) and Sarasota County (1998)
- Sarasota County Manatee Protection Plan (2011)

Navigable Depth Ranges for Typ. Vessel Drafts (ft)	Binned Bathy Depths
1.5 - 2.4	0 - 2 ft
2.5 - 3.4	2 - 3.9 ft
3.5 - >4	> 4 ft

*Based on vessels surveyed with each county, nearly 78% of all vessels within County trafficshed have an average draft ranging between 1.5 to 3 feet*

# Task 4: Evaluation of Volumes

---

## Assumptions

- a) Navigable Depth – data ranges centered on average vessel drafts for shallow and medium draft vessels.
- b) Field Data – collected depth data along 91 canals.
- c) GIS Database – allows comparison of the 2016 depths to authorized or permitted depths;
- d) Planning Template - 50% of canal width, rectangular cut along length of red and yellow shoaled areas; one way vs two way.

*Objective: Planning level estimates in order to establish a “baseline” for discussion purposes; NOT a design*

PROJECT:	C2018-006
DRAWN BY:	PL
DATE:	4/20/2018
TITLE:	NADES, MLLW
SHEET:	10 of 16

# Example 3 - Canal 32P (Key Club Moorings)

# Example 4 – Canals 36-47 (Country Club Shores)

# Task 4: Summary of Existing Conditions

---

- We evaluated 91 canals/waterways, totaling ~147,000 feet (almost 28 miles).
- We found 18 canals with some degree of “hot spot” shoaling, using our < 2 ft depth (MLLW, Red).
- Our assessment indicates these hot spots result in ‘restricted access’ during MLLW along length of about 12,500 feet (~2.4 miles), or 9% of total.
- Result in conservative estimate based only on GIS measurements and assumed boating patterns.
- Deeper draft boats would be a concern for areas in Yellow....added to Red would be about 33% of entire length.

# Task 4: Evaluation of Volumes

---

Volume of “Hot Spot” Shoaling:

a) **Red** (Depths from 0 to 2 ft MLLW): ~ 37,000 Cubic Yards

Volume of “Potentially Restricted” Shoaling:

b) **Yellow** (Depths from 2 to 4 ft MLLW): ~ 58,200 Cubic Yards

Total Volume in Red & Yellow = ~ 95, 200 CY

# Example of Limited Volume Project

*Canals 1A, 1 and portion of bridge shoal:*

*Total Volume in Red & Yellow (plus bridge)  
= ~ 11,000 Cubic Yards*

*Order of Magnitude Cost:  
~\$750,000.*

*Possibility to use dredged material for "beneficial use" on Beer Can Island*

# Example of Limited Volume Project

*Country Club Shores, Canal #s 34– 52 (19 canals):*

*Total volume in Red & Yellow = ~ 20,000 Cubic Yards  
Order of Magnitude cost: ~\$1,300,000.*

# Next Steps...

---

- Refine conceptual cost:
  - Location/type of potential dredged material dewater/transfer sites significantly drives cost
    - ID potential upland sites
    - Pursue beneficial use options (Beer Can Island?)
  - Follow up on resources (seagrasses, oysters)
  - Policy direction/confirmation of thresholds/canal priority
- Stakeholder input & funding scenarios
- Develop the project design
  - Potential future bathymetry survey in FY 2017
  - Refine dredge template (addressing presence of structures)
  - Verify regulatory status/requirements
